

Diseases of Horticultural and Floricultural Crops

The students' acquisition of specialist knowledge in the most important diseases in horticulture and flower crops.

The course aims to enable students to:

- Know and recognize the most important diseases.
- To understand and become familiar with the symptomatology, etiology and biology and ecology of pathogens, as well as the epidemiology of the most important fungal, prokaryotic, viral and non-parasitic diseases.
- Become familiar with and apply techniques for correct diagnosis of diseases.
- Quarantine phytopathogens are managed in accordance with the relevant directives and standards of the European Union.
- Deal with and properly manage phytopathological problems, related to horticulture and floriculture, in the context of conventional, integrated and biological management.
- Be updated on new and emerging diseases of horticultural and flower crops.
